2702Task2Variables in Python

May 12, 2025

```python
[14]: first_name='Sowjanya'
      last_name='Parnandi'
      country='India'
      State='Hyderabad'
      Zipcode=500081
      age=38
      is_married= True
      person_info = {
          'firstname':'Asabeneh',
          'lastname':'Yetayeh',
          'country':'Finland',
          'city':'Helsinki'
          }
```

```python
[18]: print('First name:', first_name)
      print('First name length:', len(first_name))
      print('Last name: ', last_name)
      print('Last name length: ', len(last_name))
      print('Country: ', country)
      print('Age: ', age)
      print('Married: ', is_married)
      print('Person information: ', person_info)
```

```
First name: Sowjanya
First name length: 8
Last name:  Parnandi
Last name length:  8
Country:  India
Age:  38
Married:  True
Person information:  {'firstname': 'Asabeneh', 'lastname': 'Yetayeh', 'country':
'Finland', 'city': 'Helsinki'}
```

0.0.1 Multiple Variables

```
[25]: first_name,last_name,country,age,is_married='Sowjanya','Parnandi','India',38,True
      print('First Name:',first_name)
      print('Last Name:', last_name)
      print('Country:', country)
      print('Age:', age)
      print('Married:', is_married)
```

```
First Name: Sowjanya
Last Name: Parnandi
Country: India
Age: 38
Married: True
```

```
